Technology has never been so powerful and yet well-informed people who have experienced some recent audio and audio-video formats are disenchanted. Bad subjective performances, lack of flexibility and an ever more complicated use are the major reproaches.

The real difficulties that have inexperienced designers to estimate the pros and cons of new solutions are the major reasons of this situation.

Whichever your passion for music, whichever your passion for movie cinema reproduction and for home entertainment in general, we have paid a special attention to your expectations. After due consideration, we have concluded that a new approach was necessary.

In the light of our wide experience and technical expertise we have developed the concept element. Natural sound, natural picture, intuitive use and refinement are the main features of the line.

To achieve this performance, the element range is based on a limited number of models, each one offering outstanding features. Only up-to-date and reliable technology is used.

Models element 1 and element 2 are stereo media players supporting all existing formats, one being exclusively dedicated to audio, while model element 3 is an integrated power amplifier built on a proprietary circuit.

Each unit can be used in conjunction with your existing equipment or, better, to create a complete solution from signal source to final amplification.

The element line combines unity of visual styling with sumptuous finish, together with flexibility, allowing upgrading and expansion of your home installation according to your passions, likings of your family and friends, and your budget.

Whichever your choice, you have the certitude to get a solution capable of superb playback of standard Compact Discs, Super Audio Compact Discs and DVD-Videos.

The concept element is probably the most appropriate response to the often conflicting demands of performance, convenience and value. Not only you'll feel a great satisfaction with it, but you'll be also very proud to own it.
